

UniAssist

Your intelligent university-focused learning and information assistant

UniAssist is an AI-powered academic assistant designed to help university students find, understand, and use relevant academic information more effectively. Instead of relying only on a general-purpose language model, UniAssist can ground responses in a curated knowledge base using Retrieval-Augmented Generation (RAG).

Ask Your academic question	Retrieve Relevant knowledge	Generate A grounded response
-------------------------------	--------------------------------	---------------------------------

What UniAssist Is Built To Do

Academic Q&A;	Answer questions in a conversational format while using relevant retrieved academic context to improve factual grounding.
Knowledge Retrieval	Search a structured knowledge base and bring the most relevant passages into the generation process instead of treating every question as a blank prompt.
Student-Friendly Responses	Explain complex concepts clearly, summarize source material, and help students navigate academic information without unnecessary complexity.
Conversation History	Maintain a useful record of previous interactions so students can revisit earlier questions and continue their learning workflow.

How It Works

1. User query → A student asks a question. 2. Retrieval → UniAssist searches its indexed knowledge base for relevant content. 3. Context → The retrieved information is supplied to the language model. 4. Response → The model produces a natural-language answer grounded in that context.

Why UniAssist Instead of Using an LLM Alone?

A general-purpose LLM is powerful, but it may not know an institution's specific documents, policies, course material, or continuously updated knowledge. UniAssist adds a retrieval layer so the system can connect the model with a controlled knowledge source. This makes the assistant more useful for domain-specific university workflows and gives the architecture a clear path for updating knowledge without retraining the language model.

Vision

Build a dependable digital academic companion that connects university knowledge with conversational AI—making information easier to discover, understand, and revisit.
